

PHYSICS 20323: Scientific Analysis & Modeling - Fall 2023
Project: Mudit Panda

1. The following questions refer to stars in the table below.

Note: There may be multiple answers.

Name	Mass	Luminosity	Lifetime	Temperature	Radius
μ Car.	$60. M_{\odot}$	$10^6 L_{\odot}$	8.0×10^5		
σ Eri.	$6.0 M_{\odot}$	$10^3 L_{\odot}$		20,000 K	
δ Scu.	$2.0 M_{\odot}$		5×10^8 years		$2R_{\odot}$
β Cyg.	$1.3 M_{\odot}$	$3.5 L_{\odot}$			
α Cen.	$1.0 M_{\odot}$				$1R_{\odot}$
γ Del.	$0.7 M_{\odot}$		4.5×10^{10} years	5000 K	

(a) (4 points) Which of these stars will produce a planetary nebula.

(b) (4 points) Elements heavier than *Carbon* will be produced in which stars.

2. An electron is found to be in the spin state (in the z -basis): $\chi = A \begin{pmatrix} 3i \\ 4 \end{pmatrix}$

(a) (5 points) Determine the possible values of A such that the state is normalized.

(b) (5 points) Find the expectation values of the operators S_x , S_y , S_z and \vec{S}^2

The matrix representations in the z -basis for the components of electron spin operators are given by:

$$S_x = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}; \quad S_y = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}; \quad S_z = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

3. The average electrostatic field in earth's atmosphere in fair weather is approximately given:

$$\vec{E} = E_0(Ae^{-\alpha z} + Be^{-\beta z})\hat{z} \quad (1)$$

Where A, B, α, β are positive constants and z is the height above the (locally flat) earth surface.

(a) (5 points) Find the average charge density in the atmosphere as a function of height

(b) (5 points) Find the electric potential as a function of height above the earth.
